CONSOLE ACCESSORY POWER SOCKET TEST

NOTE: **If the front and console accessory power sockets do not work, check the No. B19 (7.5 A) fuse in the under-dash fuse/relay box first.**

1. Disconnect the 2P connector from the console accessory power socket.

Fig. 2: Identifying Console Accessory Power Socket 2P Connector Terminal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Inspect the connector terminals to be sure they are making good contact.
   - If the terminals are bent, loose, or corroded, repair them as necessary and recheck the system.
   - If the terminals are OK, go to step 4.
3. Turn the ignition switch to ACCESSORY (I).
4. Measure the voltage between under-dash relay holder A terminal No. 8 and body ground. There should be less than 0.2 V.
   - If there is less than 0.2 V, go to step **5** .
   - If there is more than 0.2 V, check for:
   - An open or high resistance in the ground wire between under-dash relay holder A terminal No. 8 and ground (G501).

GETtheMANUALS.org

- Poor ground (G501).

5. Measure the voltage between console accessory power socket 2P connector terminal No. 2 and body ground. There should be battery voltage.
   - If there is battery voltage, go to step **6** .
   - If there is no voltage, check for:
   - Blown No. B12 (15 A) fuse in the under-dash fuse/relay box.
   - Faulty console accessory power socket relay.
   - Faulty under-dash fuse/relay box.
   - An open or high resistance in the wire between console accessory power socket 2P connector terminal No. 2 and under-dash fuse/relay box connector S (10P) terminal No. 7.
6. Check for continuity between console accessory power socket 2P connector No. 1 and body ground. There should be continuity.

- If there is continuity, replace the console accessory power socket.
- If there is no continuity, check for:

- Poor ground (G503).
- An open or high resistance in the ground wire between console accessory power socket 2P connector terminal No. 1 and ground (G503).

INSPECTION

NOTE:

- **If the transmission housing, the torque converter housing, the differential carrier, the carrier bearing and the outer race, or the thrust shim were replaced, the bearing preload must be adjusted.**
- **Coat all parts with ATF during installation.**
- **Do not use the thrust shim on the torque converter housing.**
- **The illustration shows AWD/4WD transmission.**

1. Carrier Bearing Preload - Inspection
    1. Make sure that the carrier bearings and bearing outer races are installed securely.
    2. Install the differential assembly (A), and install a new gasket (B) and the dowel pins (C).
    3. Install the transmission housing (D) with the transmission hanger (E), and tighten the transmission housing mounting bolts (2WD: 19 bolts, AWD/4WD: 20 bolts) in at least two steps, in a crisscross pattern.
    4. Rotate the differential assembly in both directions to seat the bearings.

GETtheMANUALS.org

Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Measure the starting torque of the differential assembly in both directions using the preload inspection tool, a torque wrench (A), and a socket (B) at normal room temperature.

   Standard

   New Bearing:

   2.7-3.9 N.m (28-40 kgf.cm, 24-35 lbf.in)

   Reused Bearing:

   2.5-3.6 N.m (25-37 kgf.cm, 22-32 lbf.in)

6. If the starting torque is out of the standard, remove the 76 mm thrust shim to adjust the starting torque.

GETtheMANUALS.org

Fig. 445: Measuring Starting Torque Of Differential Assembly Using Torque Wrench And Socket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Remove the bearing outer race (A), the 76.2 mm spacer (B), and the 76 mm thrust shim (C) by heating the transmission housing to about 212 °F (100 °C) using a heat gun (D).

NOTE:

- **Do not heat the transmission housing more than 212 °F (100 °C).**
- **Let the transmission housing cool to room temperature before installing the bearing outer race.**

8. Measure the 76 mm thrust shim thickness, and select a 76 mm thrust shim from the table. To increase the starting torque, increase the thickness of the 76 mm thrust shim. To decrease the starting torque, decrease the thickness of the 76 mm thrust shim. Changing the 76 mm thrust shim to the next size will increase or decrease starting torque about 0.3-0.4 N.m (3-4 kgf.cm, 2-3 lbf.in).

4. ATF Level Check

NOTE:

- **Keep all foreign particles out of the transmission.**
- **Check the fluid level within 60-90 seconds after turning the engine off.**
- **Higher fluid level may be indicated if the radiator fan comes on twice or more.**

1. Remove the ATF dipstick (yellow loop) (A), and wipe it with a clean cloth.
2. Insert the dipstick into the guide tube aligning the notch (B) with the guide tab (C).

3. Remove the dipstick, and check the ATF level. It should be between the upper mark (A) and the lower mark (B).
4. If the ATF level is below the lower mark, check for fluid leaks at the transmission, the hoses, and the line joints. If a problem is found, fix it before filling the transmission with ATF.

NOTE: **If the vehicle is driven when the ATF level is below the lower mark, one or more of these symptoms may occur:**

- **Transmission damage.**
- **Vehicle does not move in any gear.**
- **Vehicle accelerates poorly, and engine revs up abnormally high when starting off in forward and reverse positions.**
- **Engine vibrates at idle.**

5. If the ATF level is above the upper mark, drain the ATF to proper level.

NOTE: **If the vehicle is driven when the ATF level is above the upper mark, the vehicle may creep forward while in N, or have shifting problems.**

6. If necessary, fill the transmission with ATF through the dipstick guide tube opening (A) to bring the fluid level between the upper mark and the lower mark of the dipstick. Do not fill the fluid above the upper mark. Always use ATF DW-1 (genuine Honda automatic transmission fluid). Using a non-Honda ATF can affect shift quality.

3. Radiator Coolant - Replacement
    1. Follow the chart and pour coolant into the radiator up to the base of the filler neck.

NOTE:

- **Always use Honda Long Life Antifreeze/Coolant Type 2 or Honda Extreme Cold Weather Antifreeze/Coolant Type 2. Using a non-Honda coolant can result in corrosion, causing the cooling system to malfunction or fail.**
- **Honda Long Life Antifreeze/Coolant Type 2 is a mixture of 50 % antifreeze and 50 % water. Honda Extreme Cold Weather Antifreeze/Coolant Type 2 is a 100% concentration coolant. Do not add water to either coolant.**
- **If the vehicle is regularly used in very low temperatures (under -22 °F (-30 °C)) a 60% concentration of coolant should be used.**

Operation	Vehicle Usage (Desired Mixture)	Current Mixture	Coolant Drain	Add Amount of Honda Extreme Cold Weather Antifreeze/Coolant Type 2 (100% concentrate)	Then add Honda Long Life Antifreeze/Coolant Type 2 (50/50)
	Normal Area	50/50 60/40	Drain	None

conditioning system.

4. Turn off the engine. Check the level in the radiator and add Honda Long Life Antifreeze/Coolant Type 2 if needed.
5. Put the radiator cap securely, then start the engine again, and check for leaks.
6. Clean up any spilled engine coolant.
7. Fill the coolant reservoir to the MAX mark (A) with Honda Long Life Antifreeze/Coolant Type 2.

4. Warm Up The Engine
   1. Start the engine. Hold the engine speed at 3, 000 rpm without load in P or N until the radiator fan comes on.
   2. Park the vehicle on level ground.
   3. Turn the ignition switch to LOCK (0).
5. ATF Level Check

NOTE:

- **Keep all foreign particles out of the transmission.**
- **Check the fluid level within 60-90 seconds after turning the engine off.**
- **Higher fluid level may be indicated if the radiator fan comes on twice or more.**

   1. Remove the ATF dipstick (yellow loop) (A), and wipe it with a clean cloth.
   2. Insert the dipstick into the guide tube aligning the notch (B) with the guide tab (C).

GETtheMANUALS.org

Fig. 1431: Identifying Notch, Tab And ATF Dipstick (Yellow Loop)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the dipstick, and check the ATF level. It should be between the upper mark (A) and the lower mark (B).
4. If the ATF level is below the lower mark, check for fluid leaks at the transmission, the hoses, and the line joints. If a problem is found, fix it before filling the transmission with ATF.

NOTE: **If the vehicle is driven when the ATF level is below the lower mark, one or more of these symptoms may occur:**

- **Transmission damage.**
- **Vehicle does not move in any gear.**
- **Vehicle accelerates poorly, and engine revs up abnormally high when starting off in forward and reverse positions.**
- **Engine vibrates at idle.**

5. If the ATF level is above the upper mark, drain the ATF to proper level.

NOTE: **If the vehicle is driven when the ATF level is above the upper mark, the vehicle may creep forward while in N, or have shifting problems.**

GETtheMANUALS.org

6. If necessary, fill the transmission with ATF through the dipstick guide tube opening (A) to bring the fluid level between the upper mark and the lower mark of the dipstick. Do not fill the fluid above the upper mark. Always use ATF DW-1 (genuine Honda automatic transmission fluid). Using a non-Honda ATF can affect shift quality.
7. Insert the dipstick into the guide tube aligning the notch with the guide tab.

58. Pre-Alignment Checks

    For proper inspection and adjustment of the wheel alignment, do these checks:

    1. Release the parking brake to avoid an incorrect measurement.
    2. Make sure the suspension is not modified.
    3. Make sure the fuel tank is full, and that the spare tire, the jack, and the tools are in place on the vehicle.
    4. Check the tire size and tire pressure according to tire information.
    5. Set the steering column to the middle tilt position and telescopic position.
59. Caster - Inspection

    Use commercially available computerized four wheel alignment equipment to measure wheel alignment (caster, camber, toe, and turning angle). Follow the equipment manufacturer's instructions.

    1. Check the caster angle.

       Caster angle:

       2WD:

GETtheMANUALS.org

AWD/4WD:

With 16 inch wheel: 2 ° 38 '±30 '

Without 16 inch wheel: 2 ° 44 '±30 '

- If the measurement is within specifications, measure the front camber angle.
- If the measurement is not within specifications, check for bent or damaged suspension components.

60. Camber - Inspection

Use commercially available computerized four wheel alignment equipment to measure wheel alignment (caster, camber, toe, and turning angle). Follow the equipment manufacturer's instructions.

1. Check the camber angle.

Camber angle:

Rear:

With 16 inch wheel: -0 ° 50 '±45 '

Without 16 inch wheel: -1 ° 00 '±45 '

(Maximum difference between the front right and left side: 0 °45 ')

- If the measurement is within specification, measure the toe-in.
- If the measurement for the front camber is not within the specification, go to front camber adjustment.
- If the measurement for the rear camber is not within the specification, check for bent or damaged suspension components.

61. Front Toe - Inspection

Use commercially available computerized four wheel alignment equipment to measure wheel alignment (caster, camber, toe, and turning angle). Follow the equipment manufacturer's instructions.

1. Set the steering column to the middle tilt position and telescopic positions.
2. Center the steering wheel spokes, and install a steering wheel holder tool.
3. Check the toe with the wheels pointed straight ahead.

   Front toe-in: 0±2 mm (0±0.08 in)

   - If adjustment is required, go to the front toe adjustment.
   - If no adjustment is required, remove the alignment equipment.

62. Turning Angle - Inspection

Use commercially available computerized four wheel alignment equipment to measure wheel alignment (caster, camber, toe, and turning angle). Follow the equipment manufacturer's instructions.

1. Turn the wheel right and left while applying the brake, and measure the turning angle of both wheels.

   Turning angle:

   2WD:

   Inward:

   With 16 inch wheel: 36 ° 29 '±2 °

2. If the measurement is not within the specifications, even up both sides of the tie-rod threaded section length while adjusting the front toe.
3. If it is correct, but the turning angle is not within the specifications, check for bent or damaged suspension components.

63. Warm Up The Engine
    1. Start the engine. Hold the engine speed at 3, 000 rpm without load in P or N until the radiator fan comes on.
    2. Park the vehicle on level ground.

GETtheMANUALS.org

3. Turn the ignition switch to LOCK (0).

64. ATF Level Check

NOTE:

- **Keep all foreign particles out of the transmission.**
- **Check the fluid level within 60-90 seconds after turning the engine off.**
- **Higher fluid level may be indicated if the radiator fan comes on twice or more.**

1. Remove the ATF dipstick (yellow loop) (A), and wipe it with a clean cloth.
2. Insert the dipstick into the guide tube aligning the notch (B) with the guide tab (C).

Fig. 1680: Identifying Notch, Tab And ATF Dipstick (Yellow Loop)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the dipstick, and check the ATF level. It should be between the upper mark (A) and the lower mark (B).
4. If the ATF level is below the lower mark, check for fluid leaks at the transmission, the hoses, and the line joints. If a problem is found, fix it before filling the transmission with ATF.

NOTE: **If the vehicle is driven when the ATF level is below the lower mark, one or more of these symptoms may occur:**

- **Transmission damage.**
- **Vehicle does not move in any gear.**
- **Vehicle accelerates poorly, and engine revs up abnormally high when starting off in forward and reverse positions.**

GETtheMANUALS.org

- **Engine vibrates at idle.**

Fig. 1681: Identifying Upper And Lower Mark On Dipstick

5. If the ATF level is above the upper mark, drain the ATF to proper level.

NOTE: **If the vehicle is driven when the ATF level is above the upper mark, the vehicle may creep forward while in N, or have shifting problems.**

6. If necessary, fill the transmission with ATF through the dipstick guide tube opening (A) to bring the fluid level between the upper mark and the lower mark of the dipstick. Do not fill the fluid above the upper mark. Always use ATF DW-1 (genuine Honda automatic transmission fluid). Using a non-Honda ATF can affect shift quality.
7. Insert the dipstick into the guide tube aligning the notch with the guide tab.

66. Automatic Transmission Road - Test
    1. Apply the parking brake, and block all four wheels.
    2. Start the engine.
    3. Shift to D while pressing the brake pedal. Press the accelerator pedal, and release it suddenly. The engine should not stall.
    4. Repeat step 3 in all shift lever positions.
    5. Prepare the HDS and the MVCI to take a SNAPSHOT (refer to the user's guide for more details if needed):
        - Set the Trigger Type to Parameter.
        - Adjust the Parameter setting to APP Sensor A (V) above 1.2 V.
        - Set the recording time to 60 seconds.
        - Set the trigger point to (Negative) -30 seconds.
    6. Find a suitable level road.
    7. When you are ready to do the test, press OK on the HDS.
    8. Accelerate quickly until APP Sensor A reads 1.3 V. Maintain a steady throttle until the

GETtheMANUALS.org

transmission shifts to 5th gear, then slow the vehicle and come to a stop.

9. Save the snapshot if the entire event was recorded or increase the recording time setting as necessary, and repeat step 8.
10. Adjust the APP Sensor A parameter setting to 2.4 V.
11. Test-drive the vehicle again. Accelerate quickly until APP Sensor A reads 2.5 V. Maintain a steady throttle until the transmission shifts to 5th gear (or a reasonable speed), then slow the vehicle and come to a stop.
12. Save the snapshot if the entire event was recorded or increase the recording time setting as necessary, and repeat step 11.
13. Adjust the APP Sensor A parameter setting to 4.5 V.
14. Accelerate quickly until the accelerator pedal is to the floor. Maintain a steady pedal until the transmission shifts to 4th gear, then slow to a stop, and save the snapshot.
15. Review each snapshot individually, and compare the Shift Control, APP Sensor A (V), and the Vehicle Speed to the following table.

7. Pre-Alignment Checks

   For proper inspection and adjustment of the wheel alignment, do these checks:

   1. Release the parking brake to avoid an incorrect measurement.
   2. Make sure the suspension is not modified.
   3. Make sure the fuel tank is full, and that the spare tire, the jack, and the tools are in place on the vehicle.
   4. Check the tire size and tire pressure according to tire information.
   5. Set the steering column to the middle tilt position and telescopic position.

8. Caster - Inspection

   Use commercially available computerized four wheel alignment equipment to measure wheel alignment (caster, camber, toe, and turning angle). Follow the equipment manufacturer's instructions.

   1. Check the caster angle.

      Caster angle:

      2WD:

      With 16 inch wheel: 2 ° 44 '±30 '

      Without 16 inch wheel: 2 ° 50 '±30 '

      AWD/4WD:

      With 16 inch wheel: 2 ° 38 '±30 '

      Without 16 inch wheel: 2 ° 44 '±30 '

      - If the measurement is within specifications, measure the front camber angle.
      - If the measurement is not within specifications, check for bent or damaged suspension components.

9. Camber - Inspection

   Use commercially available computerized four wheel alignment equipment to measure wheel alignment (caster, camber, toe, and turning angle). Follow the equipment manufacturer's instructions.

   1. Check the camber angle.

      Camber angle:

GETtheMANUALS.org

2WD:

Front:

With 16 inch wheel: -0 ° 01 '±1 ° 00 '

Without 16 inch wheel: -0 ° 10 '±1 ° 00 '

Rear:

With 16 inch wheel: -1 ° 06 '±45 '

Without 16 inch wheel: -1 ° 12 '±45 '

(Maximum difference between the front right and left side: 0 °45 ')

AWD/4WD:

Front:

With 16 inch wheel: -0 ° 08 '±1 ° 00 '

Without 16 inch wheel: 0 ° 00 '±1 ° 00 '

(Maximum difference between the front right and left side: 1 °00 ')

Rear:

With 16 inch wheel: -0 ° 50 '±45 '

Without 16 inch wheel: -1 ° 00 '±45 '

(Maximum difference between the front right and left side: 0 °45 ')

- If the measurement is within specification, measure the toe-in.
- If the measurement for the front camber is not within the specification, go to front camber adjustment.
- If the measurement for the rear camber is not within the specification, check for bent or damaged suspension components.

10. Front Toe - Inspection

Use commercially available computerized four wheel alignment equipment to measure wheel alignment (caster, camber, toe, and turning angle). Follow the equipment manufacturer's instructions.

GETtheMANUALS.org

1. Set the steering column to the middle tilt position and telescopic positions.
2. Center the steering wheel spokes, and install a steering wheel holder tool.
3. Check the toe with the wheels pointed straight ahead.

   Front toe-in: 0±2 mm (0±0.08 in)

   - If adjustment is required, go to the front toe adjustment.
   - If no adjustment is required, remove the alignment equipment.

11. Turning Angle - Inspection

Use commercially available computerized four wheel alignment equipment to measure wheel alignment (caster, camber, toe, and turning angle). Follow the equipment manufacturer's instructions.

1. Turn the wheel right and left while applying the brake, and measure the turning angle of both wheels.

   Turning angle:

   2WD:

   Inward:

   With 16 inch wheel: 36 ° 29 '±2 °

   Without 16 inch wheel: 36 ° 13 '±2 °

   Outward (reference):

   With 16 inch wheel: 31 ° 13 '

   Without 16 inch wheel: 31 ° 02 '

   AWD/4WD:

   Inward:

   With 16 inch wheel: 36 ° 48 '±2 °

   Without 16 inch wheel: 36 ° 30 '±2 °

   Outward (reference):

2. If the measurement is not within the specifications, even up both sides of the tie-rod threaded section length while adjusting the front toe.
3. If it is correct, but the turning angle is not within the specifications, check for bent or damaged suspension components.

12. Warm Up The Engine
    1. Start the engine. Hold the engine speed at 3, 000 rpm without load in P or N until the radiator fan comes on.
    2. Park the vehicle on level ground.
    3. Turn the ignition switch to LOCK (0).
13. ATF Level Check

NOTE:

- **Keep all foreign particles out of the transmission.**
- **Check the fluid level within 60-90 seconds after turning the engine off.**
- **Higher fluid level may be indicated if the radiator fan comes on twice or more.**

1. Remove the ATF dipstick (yellow loop) (A), and wipe it with a clean cloth.
2. Insert the dipstick into the guide tube aligning the notch (B) with the guide tab (C).

GETtheMANUALS.org

Fig. 1723: Identifying Notch, Tab And ATF Dipstick (Yellow Loop)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the dipstick, and check the ATF level. It should be between the upper mark (A) and the lower mark (B).
4. If the ATF level is below the lower mark, check for fluid leaks at the transmission, the hoses, and the line joints. If a problem is found, fix it before filling the transmission with ATF.

NOTE: **If the vehicle is driven when the ATF level is below the lower mark, one or more of these symptoms may occur:**

- **Transmission damage.**
- **Vehicle does not move in any gear.**
- **Vehicle accelerates poorly, and engine revs up abnormally high when starting off in forward and reverse positions.**
- **Engine vibrates at idle.**

5. If the ATF level is above the upper mark, drain the ATF to proper level.

NOTE: **If the vehicle is driven when the ATF level is above the upper mark, the vehicle may creep forward while in N, or have shifting problems.**

GETtheMANUALS.org

2. Park the vehicle on level ground.
3. Turn the ignition switch to LOCK (0).

9. ATF Level Check

NOTE:

- **Keep all foreign particles out of the transmission.**
- **Check the fluid level within 60-90 seconds after turning the engine off.**
- **Higher fluid level may be indicated if the radiator fan comes on twice or more.**

1. Remove the ATF dipstick (yellow loop) (A), and wipe it with a clean cloth.
2. Insert the dipstick into the guide tube aligning the notch (B) with the guide tab (C).

Fig. 1744: Identifying Notch, Tab And ATF Dipstick (Yellow Loop)

Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. If the ATF level is below the lower mark, check for fluid leaks at the transmission, the hoses, and the line joints. If a problem is found, fix it before filling the transmission with ATF.

NOTE: **If the vehicle is driven when the ATF level is below the lower mark, one or more of these symptoms may occur:**

- **Transmission damage.**
- **Vehicle does not move in any gear.**
- **Vehicle accelerates poorly, and engine revs up abnormally high when starting off in forward and reverse positions.**
- **Engine vibrates at idle.**

5. If the ATF level is above the upper mark, drain the ATF to proper level.

NOTE: **If the vehicle is driven when the ATF level is above the upper mark, the vehicle may creep forward while in N, or have shifting problems.**

6. If necessary, fill the transmission with ATF through the dipstick guide tube opening (A) to bring the fluid level between the upper mark and the lower mark of the dipstick. Do not fill the fluid above the upper mark. Always use ATF DW-1 (genuine Honda automatic transmission fluid). Using a non-Honda ATF can affect shift quality.
7. Insert the dipstick into the guide tube aligning the notch with the guide tab.

10. Pre-Alignment Checks

    For proper inspection and adjustment of the wheel alignment, do these checks:

    1. Release the parking brake to avoid an incorrect measurement.
    2. Make sure the suspension is not modified.
    3. Make sure the fuel tank is full, and that the spare tire, the jack, and the tools are in place on the vehicle.
    4. Check the tire size and tire pressure according to tire information.
    5. Set the steering column to the middle tilt position and telescopic position.
11. Caster - Inspection

    Use commercially available computerized four wheel alignment equipment to measure wheel alignment (caster, camber, toe, and turning angle). Follow the equipment manufacturer's instructions.

    1. Check the caster angle.

       Caster angle:

       2WD:

       With 16 inch wheel: 2 ° 44 '±30 '

       Without 16 inch wheel: 2 ° 50 '±30 '

       AWD/4WD:

       With 16 inch wheel: 2 ° 38 '±30 '

       Without 16 inch wheel: 2 ° 44 '±30 '

GETtheMANUALS.org

- If the measurement is within specifications, measure the front camber angle.
- If the measurement is not within specifications, check for bent or damaged suspension components.

12. Camber - Inspection

    Use commercially available computerized four wheel alignment equipment to measure wheel alignment (caster, camber, toe, and turning angle). Follow the equipment manufacturer's instructions.

    1. Check the camber angle.

       Camber angle:

       2WD:

       Front:

       With 16 inch wheel: -0 ° 01 '±1 ° 00 '

       Without 16 inch wheel: -0 ° 10 '±1 ° 00 '

       (Maximum difference between the front right and left side: 1 °00 ')

       Rear:

       With 16 inch wheel: -1 ° 06 '±45 '

       Without 16 inch wheel: -1 ° 12 '±45 '

       (Maximum difference between the front right and left side: 0 °45 ')

       AWD/4WD:

       Front:

       With 16 inch wheel: -0 ° 08 '±1 ° 00 '

       Without 16 inch wheel: 0 ° 00 '±1 ° 00 '

       (Maximum difference between the front right and left side: 1 °00 ')

       Rear:

       With 16 inch wheel: -0 ° 50 '±45 '

       Without 16 inch wheel: -1 ° 00 '±45 '

GETtheMANUALS.org

(Maximum difference between the front right and left side: 0 °45 ')

- If the measurement is within specification, measure the toe-in.
- If the measurement for the front camber is not within the specification, go to front camber adjustment.
- If the measurement for the rear camber is not within the specification, check for bent or damaged suspension components.

13. Front Toe - Inspection

Use commercially available computerized four wheel alignment equipment to measure wheel alignment (caster, camber, toe, and turning angle). Follow the equipment manufacturer's instructions.

1. Set the steering column to the middle tilt position and telescopic positions.
2. Center the steering wheel spokes, and install a steering wheel holder tool.
3. Check the toe with the wheels pointed straight ahead.

Front toe-in: 0±2 mm (0±0.08 in)

- If adjustment is required, go to the front toe adjustment.
- If no adjustment is required, remove the alignment equipment.

14. Turning Angle - Inspection

Use commercially available computerized four wheel alignment equipment to measure wheel alignment (caster, camber, toe, and turning angle). Follow the equipment manufacturer's instructions.

1. Turn the wheel right and left while applying the brake, and measure the turning angle of both wheels.

Turning angle:

2WD:

Inward:

With 16 inch wheel: 36 ° 29 '±2 °

Without 16 inch wheel: 36 ° 13 '±2 °

Outward (reference):

With 16 inch wheel: 31 ° 13 '

Without 16 inch wheel: 31 ° 02 '

Without 16 inch wheel: 36 ° 30 '±2 °

Outward (reference):

With 16 inch wheel: 31 ° 18 '

Without 16 inch wheel: 31 ° 12 '

2. If the measurement is not within the specifications, even up both sides of the tie-rod threaded section length while adjusting the front toe.
3. If it is correct, but the turning angle is not within the specifications, check for bent or damaged suspension components.

15. Test Drive
    1. Test-drive the vehicle.
16. HDS DLC - Connection
    1. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.

comes on.

2. Park the vehicle on level ground.
3. Turn the ignition switch to LOCK (0).

7. ATF Level Check

NOTE:

- **Keep all foreign particles out of the transmission.**
- **Check the fluid level within 60-90 seconds after turning the engine off.**
- **Higher fluid level may be indicated if the radiator fan comes on twice or more.**

1. Remove the ATF dipstick (yellow loop) (A), and wipe it with a clean cloth.
2. Insert the dipstick into the guide tube aligning the notch (B) with the guide tab (C).

Fig. 1865: Identifying Notch, Tab And ATF Dipstick (Yellow Loop)

3. Remove the dipstick, and check the ATF level. It should be between the upper mark (A) and the lower mark (B).
4. If the ATF level is below the lower mark, check for fluid leaks at the transmission, the hoses, and the line joints. If a problem is found, fix it before filling the transmission with ATF.

NOTE: **If the vehicle is driven when the ATF level is below the lower mark, one or more of these symptoms may occur:**

- **Transmission damage.**
- **Vehicle does not move in any gear.**

GETtheMANUALS.org

- **Vehicle accelerates poorly, and engine revs up abnormally high when starting off in forward and reverse positions.**
- **Engine vibrates at idle.**

5. If the ATF level is above the upper mark, drain the ATF to proper level.

Fig. 1866: Identifying Upper And Lower Mark On Dipstick

NOTE: **If the vehicle is driven when the ATF level is above the upper mark, the vehicle may creep forward while in N, or have shifting problems.**

6. If necessary, fill the transmission with ATF through the dipstick guide tube opening (A) to bring the fluid level between the upper mark and the lower mark of the dipstick. Do not fill the fluid above the upper mark. Always use ATF DW-1 (genuine Honda automatic transmission fluid). Using a non-Honda ATF can affect shift quality.
7. Insert the dipstick into the guide tube aligning the notch with the guide tab.

HOW TO TROUBLESHOOT THE A/T SYSTEM

HOW TO CHECK FOR DTCS WITH THE HONDA DIAGNOSTIC SYSTEM (HDS)

When the powertrain control module (PCM) senses an abnormality in the input or output system, the D indicator (A) in the gauge control module (B) will usually blink.

Fig. 1: Identifying D Indicator And Gauge Control Module
Courtesy of AMERICAN HONDA MOTOR CO., INC.

When the Honda Diagnostic System (HDS) is connected to the data link connector (DLC) (A) located under the driver's side of the dashboard, and when the ignition switch is turned to ON (II), and the appropriate menu is selected, it will indicate the diagnostic trouble code (DTC).

GETtheMANUALS.org

Fig. 2: Locating Data Link Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

If the D indicator or the malfunction indicator lamp (MIL) has been reported on, or if a driveability problem is suspected, follow this procedure:

1. Connect the HDS to the DLC. (See the HDS user's manual for specific instructions.)
2. Turn the ignition switch to ON (II). Make sure the HDS communicates with the PCM. If it does not, **GO TO THE DLC CIRCUIT TROUBLESHOOTING.**
3. Check for Pending or Confirmed DTCs with the HDS.
4. Record the freeze data and the on-board snapshots for all fuel and emissions DTCs and A/T DTCs.
5. If there is a fuel and emissions DTC, first check the fuel and emissions system as indicated by the DTC.
6. Clear the DTC.
7. Drive the vehicle for several minutes under the same conditions as those indicated by the freeze data or the on-board snapshot, and then recheck for the DTC. If the A/T DTC returns, go to the indicated DTC's troubleshooting. If the DTC does not return, there was an intermittent problem within the circuit. Make sure all pins and terminals in the circuit are tight.

SYMPTOM TROUBLESHOOTING VERSUS DTC TROUBLESHOOTING

Some symptoms will not set DTCs or cause the D indicator to blink. If the MIL was reported ON or the D indicator has been blinking, check for DTCs. If the vehicle has an abnormal symptom, and there are no DTCs stored, do the symptom troubleshooting. Check the list of probable cause (s) for the symptom, in the sequence listed, until you find the problem.

HOW TO CHECK FOR DTCS WITH THE SCS MODE (RETRIEVING THE FLASH CODES)

NOTE: The preferred method is to use the HDS to retrieve the DTCs.

When the PCM senses an abnormality in the input or output system, the D indicator (A) in the gauge control module (B) will usually blink.

GETtheMANUALS.org

Fig. 3: Identifying D Indicator And Gauge Control Module
Courtesy of AMERICAN HONDA MOTOR CO., INC.

When the D indicator has been reported on, connect the HDS to the DLC (A) located under the driver's side of the dashboard. Turn the ignition switch to ON (II), select SCS mode, then the D indicator will indicate (blink) the DTC.

Fig. 4: Locating Data Link Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

If the D indicator and the MIL come on at the same time, or if a driveability problem is suspected, follow this procedure:

1. Connect the HDS to the DLC. (See the HDS user's manual for specific instructions.)
2. Turn the ignition switch to ON (II). Make sure the HDS communicates with the PCM. If it does not, **GO TO THE DLC CIRCUIT TROUBLESHOOTING.**

GETtheMANUALS.org

3. Select SCS mode, then observe the D indicator in the gauge control module. Codes 1 through 9 are indicated by individual short blinks. Code 10 and above are indicated by a series of long and short blinks. One long blink equals 10 short blinks. Add the long and short blinks together to determine the code.

Fig. 5: Identifying D Indicator Long And Short Blinks
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Record all fuel and emissions DTCs and A/T DTCs.
5. If there is a fuel and emissions DTC, first check the fuel and emissions system as indicated by the DTC.
6. Clear the DTC.
7. If the freeze data is available, drive the vehicle for several minutes with periods of wide open throttle, steady cruise, and stop and go, and then recheck for DTCs. If the A/T DTC returns, go to the indicated DTC's troubleshooting. If the DTC does not return, there was an intermittent problem within the circuit. Make sure all pins and terminals in the circuit are tight.

HOW TO TROUBLESHOOT CIRCUITS AT THE PCM CONNECTORS

NOTE: **The PCM stays on about an hour after the ignition switch is turned to LOCK (0). Jumping the SCS line after turning the ignition switch to LOCK (0) cancels this function. Disconnecting the PCM during this function, without jumping the SCS line first, can damage the PCM.**

1. Jump the SCS line with the HDS.
2. Remove the cover (A).

GETtheMANUALS.org

3. Disconnect PCM connectors A, B, and C.

NOTE: **PCM connectors A, B, and C have symbols (A=[], B=[], C=o) embossed on them for identification.**

Fig. 7: Disconnecting PCM Connectors A, B, And C
Courtesy of AMERICAN HONDA MOTOR CO., INC.

GETtheMANUALS.org

4. When diagnosis/troubleshooting is done at the PCM connector, use the terminal test port (A) above the terminal you need to check.

Fig. 8: Identifying Terminal Test Port
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Connect one side of the patch cord terminals (A) to a commercially available digital multimeter (B), and connect the other side of the terminals (C) to a commercially available banana jack (Pomona Electronics Tool No. 3563 or equivalent) (D).

Fig. 9: Connecting Other Side Of Terminals To Commercially Available Banana Jack (Pomona Electronics Tool No. 3563 Or Equivalent)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Gently contact the pin probe (male) at the terminal test port from the terminal side. Do not force the tips into the terminals.

NOTE:

- **For accurate results, always use the pin probe (male).**
- **To prevent damage to the connector terminals, do not insert test equipment probes, paper clips, or other substitutes as they can damage the terminals. Damaged terminals cause a poor connection and an incorrect measurement.**
- **Do not puncture the insulation on a wire. Punctures can cause or eventually lead to poor or intermittent electrical connections.**

GETtheMANUALS.org

CLEAR A/T DTCS PROCEDURE

1. Connect the HDS to the DLC (A) located under the driver's side of the dashboard.

Fig. 10: Locating Data Link Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the ignition switch to ON (II).
3. Make sure the HDS communicates with the PCM. If it does not, **GO TO THE DLC CIRCUIT TROUBLESHOOTING.**
4. Clear the DTC(s) on the HDS screen.

OBD STATUS

The OBD STATUS shows the current system status of each DTC and all of the parameters. This function is used to see if the repair was successfully completed. The results of diagnostic tests for the DTC are displayed as:

- PASSED: The on-board diagnosis is successfully completed.
- FAILED: The on-board diagnosis has completed but failed.
- NOT COMPLETED: The on-board diagnosis was running but is out of the enable conditions of the DTC.

HOW TO END A TROUBLESHOOTING SESSION (REQUIRED AFTER ANY TROUBLESHOOTING)

NOTE: Reset the PCM/TCM with the HDS while the engine is stopped.

1. Turn the ignition switch to LOCK (0).
2. Turn the ignition switch to ON (II), and wait for 30 seconds, then disconnect the HDS from the DLC.
3. Start the engine with the shift lever in P or N, and warm it up to normal operating temperature (the radiator fan comes on).

GETtheMANUALS.org

4. To verify that the problem is repaired, test-drive the vehicle for several minutes at speeds over 31 mph (50 km/h) or under the same conditions as those indicated by the freeze data.

PCM/TCM RESET

NOTE: To reset the PCM/TCM, initialize only the automatic transmission memory stored in the PCM or the TCM.

1. Select the A/T system with the HDS.
2. Reset the PCM/TCM with the HDS while the engine is stopped.
3. Turn the ignition switch to LOCK (0).
4. Turn the ignition switch to ON (II), and wait for 30 seconds, then disconnect the HDS from the DLC.

FAILURE REPRODUCTION TECHNIQUE

NOTE: Make sure to follow these points while the vehicle is raised on a lift for the test-drive.

- Disable the VSA (if equipped) by pressing the VSA OFF button.
- ABS or VSA DTC(s) may come on when test-driving on a lift. If the ABS or VSA DTC(s) come on, clear the DTC(s) with the HDS.

SELF-DIAGNOSIS
